It's important to understand that these metabolic processes can vary significantly between individuals. Some people may have a higher basal metabolic rate (BMR) due to factors like genetics, age, and body composition. This means they burn more calories at rest. Conversely, others may have a lower BMR. The intensity and duration of your workouts also play a major role in how many calories you burn. High-intensity interval training (HIIT) and strength training can significantly increase your metabolic rate, even after the workout is over (the afterburn effect). Consistency is key. Regular exercise, combined with a balanced diet, is the most effective way to manage your weight and improve your overall health. Remember, everyone's body is different, so it's important to listen to your body and adjust your routine accordingly.
