

royal seven casino

Given odds against of an event say A is give to be 7 : 2, therefore probability of A is $P(A) = \frac{2}{7+2} = \frac{2}{9}$ and probability of B is $P(B) = \frac{7}{9}$. If it is as in favor of A, the probability of B is $P(B) = \frac{7}{9}$. In the case of a bet on B, the odds are 7 to 2 in favor of B.

As both events are mutually exclusive, the probability of either event occurring is $P(A \cup B) = P(A) + P(B) = \frac{2}{9} + \frac{7}{9} = 1$.

It is important that these terms are used to describe the final result of the game, as they affect the real results.

The result of the game was 1 goal in favor of team 1.

The result of the game was 2 goals in favor of team 2.

Some variants of these terms are used, such as for example:

- 1t: First time won with a goal difference of 1.
- 2t: Second time won with a goal difference of 1.

But it is important to note that these variants do not necessarily correspond to the original terms.

In summary, the terms 1t and 2t are used to describe the final result of the football game. Where the first hour comes with a score of 0 to 0 and the second hour comes with a score of 1 to 0.

It is important that these terms are used as a form of knowledge of the final result of the game or the real results.
